WHAT IS THE THYROID GLAND?

The thyroid gland is a butterfly-shaped endocrine gland that is normally located in the lower front of the neck. The thyroid's job is to make thyroid hormones, which are secreted into the blood and then carried to every tissue in the body. Thyroid hormone helps the body use energy, stay warm and keep the brain, heart, muscles, and other organs working as they should.

OVERVIEW

lodine is essential for the production of thyroid hormone and must come from your diet, since the body does not make iodine. Iodine is found in various foods and is present naturally in soil and seawater. The U.S. is generally an iodine sufficient area, but many other parts of the world are considered iodine deficient. Approximately 40% of the world's population remains at risk for iodine deficiency.

1 SYMPTOMS

What are the symptoms of iodine deficiency?

All of the symptoms of iodine deficiency are related to its effect on the thyroid:

- Goiter Without adequate iodine, the thyroid progressively enlarges (develops a goiter) as it tries to keep up with demand for thyroid hormone production. Worldwide, iodine deficiency is the most common cause of a goiter (see *Goiter brochure*). Within a goiter, nodules can develop. Patients with a large goiter may experience symptoms of choking, especially when lying down, and difficulty swallowing and breathing.
- Hypothyroidism As the body's iodine levels fall, hypothyroidism may develop, since iodine is essential for making thyroid hormone. While this is uncommon in the U.S., iodine deficiency is the most common cause of hypothyroidism worldwide (see *Hypothyroidism brochure*).
- Pregnancy-related problems lodine deficiency is especially important in women who are pregnant or nursing their infants. Severe iodine deficiency in the mother has been associated with miscarriages, stillbirth, preterm delivery, and congenital abnormalities in their babies. Children of mothers with severe iodine deficiency during pregnancy can have intellectual disabilities and problems with growth, hearing, and speech. Even mild iodine deficiency during pregnancy, which may be present in some women in the U.S., may be associated with low intelligence in children.

2 CAUSES

What are the causes of iodine deficiency?

Since the body does not make iodine, it relies on the diet to have enough iodine. The availability of iodine in foods differs in various regions of the world. Individuals in the U.S. can maintain adequate iodine in their diet by using iodized table salt (unless they have to restrict the amount of salt in their diet), by eating foods high in iodine, particularly dairy products, seafood, meat, some breads, and eggs, and by taking a multivitamin containing iodine. However, the amount of iodine in foods is not listed on food packaging in the U.S., and it can be difficult to identify sources of iodine in foods. See the *lodine Deficiency Brochure* for a list of food items rich in iodine.

3 DIAGNOSIS

How is iodine deficiency diagnosed?

lodine deficiency is diagnosed across populations and not specifically in individuals. There are no tests to confirm if you have enough iodine in your body. When deficiency is seen in an entire population, it is best managed by ensuring that common foods that people eat contain sufficient levels of iodine.

4 TREATMENT

What is the treatment for iodine deficiency?

As with many diseases, the best treatment in prevention. The U.S. Institute of Medicine has set the Recommended Dietary Allowance (RDA) for iodine in adults at 150 mg/day. Individuals who add tablet salt to their food regularly should use iodized salt. One teaspoon of iodized salt contains approximately 400 mg iodine. Most iodine-containing multivitamins have at least 150 mg iodine, but only about half of the types of multivitamins in the U.S. contain iodine.

During pregnancy, the RDA is 220 mg iodine/day and for breastfeeding women it is 290 mg iodine/day. The ATA® has recommended that all pregnant and breastfeeding women in the U.S. and Canada take a prenatal multivitamin containing 150 mg iodine/day.
